

43% of U.S. Adults Comfortable Interacting With People Who Have HIV

This is an improvement from 36% in 2020, notes this year's State of HIV Stigma Report and survey from GLAAD.

December 12, 2022 By [Trent Straube](#)

Nearly 9 out of 10 adults agree that there is still [stigma](#) around HIV. The same survey found that 43% of adults are comfortable interacting with people living with HIV. Put in a larger context, this shows an improvement in the public's attitudes toward people with HIV. Two years ago, 36% of respondents reported feeling comfortable around people with [HIV](#). Such findings are detailed in the 2022 State of HIV Stigma Report. Spearheaded by the LGBTQ advocacy group [GLAAD](#), the third annual report tracks the attitudes and knowledge of U.S. adults regarding HIV.

“While the findings show progress made, they also show work to be done,” writes Sarah Kate Ellis, the president and CEO of GLAAD, [in the report’s introduction](#). “Our report this year reveals progress toward easing HIV stigma, through increasing knowledge, comfort and greater understanding that HIV can be treated to the point of being undetectable and therefore untransmittable ([U=U](#)) and the importance of [PrEP](#) [pre-exposure prophylaxis] for prevention.”

GLAAD highlights additional [findings in a press release](#):

- 87% of adults agree there is still stigma around HIV;
- 50% feel knowledgeable about HIV;
- 67% agree that medications exist to protect someone from contracting HIV, up 3 points from 2021;
- 46% agree that people living with HIV who are on proper medication cannot transmit the virus, up 4 points from 2021;
- 43% are comfortable interacting with people living with HIV, compared to 36% in 2020;
- Only 31% noted seeing a story about a person living with HIV in the last 12 months.

Released to coincide with [World AIDS Day](#), marked each December 1, research for the report was conducted via an online survey of 2,536 U.S. adults and was funded by [Gilead Sciences’ COMPASS](#) initiative—the name stands for “COMmitment to Partnership in Addressing HIV/AIDS in Southern States.”

Danny Harris, the executive director of COMPASS grantee [Engaging Arkansas Communities](#), notes that stigma varies according to region. “In our rural state, access to quality information for HIV is limited,” Harris said in the press release. “Those who would honestly seek to broaden their knowledge are hindered because the news does not reach them. People living with HIV constantly deal with negative words, thoughts, beliefs directed toward them and systems that label them as socially unacceptable. These negative attitudes hinder engagement in HIV care and prevention. Stigma in Arkansas is not only created by the uninformed but too often by those providing

services. HIV service providers, state-funded HIV program and mental health services must do more to encourage clients to get tested and treated and avoid stigmatizing words and policies.”

Media portrayals of people living with HIV also influence stigma. “Only a third of Americans saw a story about people living with HIV in the media in the previous year,” GLAAD’s Ellis said. The public’s growing comfort around people with HIV, she said, “must continue to be paired with greater visibility of people living with HIV in the media, including the reality that they live long and healthy lives. GLAAD’s most recent ‘Where We Are on TV 2021–2022’ report showed that—despite an approximate 1.2 million people living with HIV in the U.S. and despite GLAAD’s challenge to Hollywood to introduce at least three new regular or recurring [LGBTQ](#) characters living with HIV each year in scripted primetime broadcast, cable or streaming shows—there were only two characters living with HIV on TV. This marks a decrease from the prior year’s three characters, and a significant decrease from the nine characters two years ago. Additionally, both those shows have since been canceled.”

Ellis continued: “Newly released data show how stigma, inadequate resources and lack of comprehensive public health messaging set back the fight against HIV during the [COVID-19 pandemic](#) and delayed response to the [monkeypox \(mpox\)](#) virus outbreak this year. There is no more time to waste. With accurate representation and visibility in the media and by elevating accurate and inclusive information, we can end the HIV epidemic.”
