

A Positive Racial Identity May Improve Black Teens' Mental Health

April 4, 2013

Many adolescents who belong to ethnic minority groups grapple with self-esteem issues and face social stigma. But a sense of ethnic pride might boost these young people's mental health, according to a study published in the journal [Child Development](#).

For the study, researchers at Northwestern University, Loyola University Chicago and Walden University studied more than 250 urban African-American youths from low-income families. Scientists found that when black teens' ethnic pride increased between seventh and eighth grades, their mental health also improved. Findings also offer promise for African-American teens with low self-esteem: Possessing ethnic pride shielded them from certain mental health problems.

In addition, researchers found that racial identity was a stronger buffer against symptoms of depression for boys than for girls.

The findings implied that ethnic pride may be as important as self-esteem to the mental health of African-American adolescents. "Parents, schools and therapists should expose young people to materials and environments that help cultivate a sense of ethnic pride," said Jelani Mandara, PhD, an associate professor of human development and social policy at Northwestern University and the study's lead author.
