

But What About Georgia's HIV and LGBTQ Situation?

There's more to consider in Georgia than this week's runoff elections—for example, its HIV epidemic and LGBTQ health equity.

January 4, 2021 By [Trent Straube](#)

LGBTQ Georgians are more likely to be living with HIV than their counterparts in other Southern states. That's one key finding from a survey on the health of Georgia's LGBTQ population; a related report highlights the data as the nation turns its eyes to the state and its January 5 runoff elections—races that will decide which party controls the U.S. Senate.

The findings come from [The Report of the 2019 Southern LGBTQ Health Survey](#). The survey included more than 5,600 LGBTQ people across the region, including 350 in Georgia. Over 425,000 LGBTQ people live in Georgia, according to a [press release about the report](#), which was produced by the Campaign for Southern Equality and Western North Carolina Community Health Services.

[A supplement to the survey focuses on Georgia respondents](#). A section about HIV reads:

This South is the modern-day epicenter of the HIV crisis in the United States. Participants of the Southern LGBTQ Health Survey reported disproportionately high rates of living with HIV. Of our full survey sample, 5% indicated that they were living with HIV, four points higher than the general U.S. population.

In our overall sample, HIV rates were highest among Black or African American respondents (22% are living with HIV); respondents who are 45 years of age or older (9.6%); gay respondents (13.9%); and trans women of color (90.9% of the women in our sample who report living with HIV are trans women of color).

HIV rates were slightly higher in Georgia than the overall sample, with 8% of respondents from Georgia living with HIV. Trans Georgians and Georgians of color were more likely to be living with HIV than cisgender and white respondents. Georgians also report being less knowledgeable about HIV prevention than our overall sample, with roughly 20% of LGBTQ Georgians reporting fair or poor knowledge of HIV prevention compared to 16% of the general sample. This was especially true for trans participants from Georgia.

[Data from the Centers for Disease Control and Prevention](#) (CDC) back up the survey's findings. For example, in 2018, Georgia ranked fourth in the nation in new HIV diagnoses, with 2,501 cases. (California was first, with 4,712, followed by Florida with 4,573 and then Texas with 4,388.)

A [Georgia Department of Public Health report on the state's HIV care continuum](#)—which the CDC defines as the series of steps from the time a person is diagnosed with HIV through the successful treatment of the virus with HIV medications—showed that of 57,824 adults and adolescents living with diagnosed HIV in 2018, 69% had received any care, 52% were retained in care and 55% were virally suppressed, also referred to as having an undetectable viral load. (For more about this, see the [POZ Basics on HIV/AIDS](#), notably the section on [Starting HIV Treatment](#).)

Returning to the 2019 LGBT health survey, other key findings in Georgia include:

- Transgender respondents in Georgia report low quality of care and negative physical health and mental outcomes including high rates of depression, suicidal ideation and self-harm.
- LGBTQ Georgians fear and experience harassment and violence due to their LGBTQ identity at alarming rates, especially trans respondents and respondents of color.
- Trans participants in Georgia more often experience poorer treatment from providers than cisgender participants in Georgia.
- LGBTQ Georgians are slightly more politically engaged than participants from other states in the region. Nearly 92% of the people who participated in the 2019 Southern LGBTQ Health Survey are registered to vote. Further, 80% of people surveyed believe that their vote has a positive impact.

Given this last finding, LGBTQ Georgians will likely let their political views be known when they cast their vote in the January 5 runoff.
