

Many Black, Latino People Can't Get Opioid Addiction Medications. Medicaid Cuts May Make it Harder

Opioid overdose deaths are up in communities of color, even as they decrease overall.

September 17, 2025 By Stateline

Pharmacies in Black and Latino neighborhoods are less likely to dispense buprenorphine — one of the main treatments for opioid use disorder — even though people of color are more likely to die from opioid overdoses.

The drug helps reduce cravings for opioids and the likelihood of a fatal overdose.

While the nation as a whole has seen decreases in opioid overdose deaths in recent years, overdose deaths among Black, Latino and Indigenous people have continued [to increase](#).

Many medical and health policy experts fear the broad domestic policy law President Donald Trump signed in July will worsen the problem by increasing the number of people without health insurance. As a result of the law, the number of people without coverage will increase by about 10 million by 2034, [according to the Congressional Budget Office](#).

About 7.5 million of the people who will lose coverage under the new law are covered by Medicaid. Shortly before Trump signed the bill into law, researchers from the University of Pennsylvania and Boston University [estimated](#) that roughly 156,000 Medicaid recipients will lose access to medications for opioid addiction because of the cuts, resulting in approximately 1,000 more overdose deaths annually.

Because Black and Hispanic people are [overrepresented on the rolls](#), the Medicaid cuts will have a disproportionate effect on communities that already face higher barriers to getting medications to treat addiction.

From 2017 to 2023, the percentage of U.S. retail pharmacies regularly dispensing buprenorphine increased from 33% to 39%, according to a [study](#) published last week in Health Affairs.

But researchers found the drug was much less likely to be available in pharmacies in mostly Black (18% of pharmacies) and Hispanic neighborhoods (17%), compared with mostly white ones (46%).

In some states, the disparity was even worse. In [California](#), for example, only about 9% of pharmacies in Black neighborhoods dispensed buprenorphine, compared with 52% in white neighborhoods.

The researchers found buprenorphine was least available in Black and Latino neighborhoods across nearly all states.

Barriers to treatment

Dr. Rebecca Trotzky-Sirr, a family physician who specializes in addiction medicine, said many communities of color are “pharmacy deserts.” Even the pharmacies that do exist in those neighborhoods tend to “have additional barriers to obtain buprenorphine and other controlled substances out of a concern for historic overuse of some treatments,” said Trotzky-Sirr, who wasn’t involved in the study.

In addition to its federal classification as a controlled substance, buprenorphine is also subject to state regulations to prevent illegal use. [Pharmacies](#) that carry it know that wholesalers and distributors audit their orders, which dissuades some from stocking or dispensing it.

Dima Qato, associate professor of clinical pharmacy at the University of Southern California and an author of the Health Affairs study, said that without changes in policy, Black and Hispanic people will continue to have an especially hard time getting buprenorphine.

“If you don’t address these dispensing regulations, or regulate buprenorphine from the aspect of pharmacy regulations, people are still going to encounter barriers accessing it,” she said.

In neighborhoods where at least a fifth of the population is on Medicaid, just 35% of pharmacies dispensed buprenorphine, Qato and her team found. But in neighborhoods with fewer residents on Medicaid, about 42% of pharmacies carried the drug.

Medicaid covers nearly [half](#) — 47% — of nonelderly adults who suffer from opioid use disorder. In states that expanded Medicaid under the Affordable Care Act, another recent study found an [increase](#) in people getting prescriptions for buprenorphine.

“Medicaid is the backbone of care for people struggling with opioid use disorder,” said Cherlette McCullough, a Florida-based mental health therapist. “We’re going to see people in relapse. We’re going to see more overdoses. We’re going to see more people in the ER.”

Qato said the shortage of pharmacies in minority communities is likely to get worse, as many independent pharmacists are already [struggling to stay open](#).

“We know they’re more likely to close in neighborhoods of color, so there’s going to be even fewer pharmacies that carry it in the neighborhoods that really need it,” she said.

‘There needs to be urgency’

Qato and her colleagues say states and local governments should mandate that pharmacies carry a minimum stock of buprenorphine and dispense it to anyone coming in with a legitimate prescription. As examples, they point to a Philadelphia ordinance mandating that pharmacies carry the opioid overdose-reversal drug naloxone and similar emergency contraception requirements in Massachusetts.

“We need to create expectations. We need to encourage our pharmacies to carry this to make it accessible, same day, and there needs to be urgency,” said Arianna Campbell, a physician assistant and co-founder of the Bridge Center, a California-based organization that aims to help increase addiction treatment in emergency rooms.

“In many of the conversations I have with pharmacies, when I’m getting some pushback, I have to say: ‘Hey, this person’s at the highest risk of dying right now. They need this medication right now.’”

She said patients frequently become discouraged due to barriers they face in getting prescriptions filled. The Bridge Center has been expanding its patient navigator program across the state, and helping other states start their own. The program helps patients identify pharmacies where they can fill their prescription fastest.

“There’s a medication that can help you, but at every turn it’s really hard to get it,” she said, calling the disparities in access to medication treatment “unacceptable.”

Trotzky-Sirr, the California doctor, fears the looming Medicaid cuts will cause many of her patients to discontinue treatment and relapse. Many of her patients are covered by Medi-Cal, the state’s Medicaid program.

“A lot of our patients are able to obtain medications for treatment of addiction like buprenorphine, because of the state covering the cost of the medication,” said Trotzky-Sirr, who also is a regional coordinator at the Bridge Center.

“They don’t have the resources to pay for it, cash, out of pocket.”

Some low-income patients switch between multiple providers or clinics as they try to find care and coverage, she added. These could be interpreted as red flags to a pharmacy.

Trotzky-Sirr argued buprenorphine does not need to be monitored as carefully as opioids and other drugs that are easier to misuse or overuse.

“Buprenorphine does not have those features and really needs to be in a class by itself,” she said. “Unfortunately, it’s hard to explain that to a pharmacist in 30 seconds over the phone.”

More is known about the medication now than when it was placed on the controlled substances list

about two decades ago, said Brendan Saloner, a professor at the Brown University School of Public Health.

Pharmacies are fearful of regulatory scrutiny and don't have "countervailing pressure" to ensure patients get the treatments, he said.

On top of that fear, Medicaid managed care plans' prior authorization processes may also be adding to the pharmacy bottleneck, he said.

"Black and Latino communities have higher rates of Medicaid enrollment, so to the extent that Medicaid prior authorization techniques are a hassle to pharmacies, that may also kind of discourage them [pharmacies] from stocking buprenorphine," he said.

In some states, buprenorphine is much more readily available. In Maine, New Hampshire, Oregon, Rhode Island, Utah and Vermont, more than 70% of pharmacies carried the drug, according to the study. Buprenorphine availability was highest in states such as [Oregon](#) that have the least restrictive regulations for dispensing it.

In contrast, less than a quarter of pharmacies in Iowa, North Dakota, Texas, Virginia and Washington, D.C., carried the medication.

"We're going to see more people becoming unhoused, because without treatment, they're going to go back to those old habits," McCullough, the Florida therapist, said. "When we talk about marginalized communities, these are the populations that are going to suffer the most because they already have challenges with access to care."
